

The Faculty of Technology's canteen plays a central role in daily campus life, serving hundreds of students and staff. However, the current system suffers from inefficiencies that impact service quality, user satisfaction, and operational effectiveness. These inefficiencies may arise from outdated processes, lack of digital integration, or poor adaptability to changing needs.

Your challenge is to investigate the canteen's existing operations, identify key pain points, and design a technology-driven solution that meaningfully improves the overall experience. You are free to define the scope, approach, and technology stack of your solution. The goal is to create a solution that is innovative, practical, and impactful in the context of a university canteen.
